## PYCARTOOL.IO PACKAGE

## 1.1 Submodules

## 1.2 pycartool.io.montage module

`pycartool.io.montage.read_xyz(filename, kind=)`

Reads and convert xyz positions to a mne montage type

**Parameters** `filename` (*str*) – The filename of the xyz file.

**Returns** `montage` – Montage for EEG electrode locations.

**Return type** `mne.channels.montage.Montage`

## 1.3 pycartool.io.sef module

`pycartool.io.sef.read_sef(path)`

Reads file with format .sef, and returns a mne.io.Raw object containing the data.

**Parameters** `path` (*str*) – The path of the sef file.

**Returns** `raw` – RawArray containing the EEG signals.

**Return type** `mne.io.RawArray`

`pycartool.io.sef.write_sef(path, raw)`

Export a raw mne file to a sef file.

**Parameters**

- `path` (*str*) – Filename of the exported dataset.
- `raw` (*instance of mne.io.Raw*) – The raw data to export.

## 1.4 pycartool.io.roi module

`pycartool.io.roi.read_roi(filename)`

Read Cartool region of interest (.rois) files.

**Parameters** `filename` (*str*) – The roi file to read

**Returns****Rois –****The Rois info info. Keys are:****names** [list of str] the rois names.**elements :list of int** the indices of elements belonging to each rois (indice start to 1).**Return type** dict of str

**Warning:** Indexes start from 1, not 0 as Cartools does. When using with combination of source space, you way need to tranform to 0 base indices.

## 1.5 pycartool.io.source\_space module

`pycartool.io.source_space.read_spi(filename)`

Read Cartool spi file.

**Parameters** `filename` (*str*) – The spi file to read.**Returns**

- **coord** (*ndarray, shape (n\_sources, 3)*) – the source coordinates.
- **names** (*list, shape (n\_sources)*)

`pycartool.io.source_space.write_spi(filename, solution_points)`

Write Cartool spi file.

**Parameters**

- **filename** (*str*) – The spi file to write.
- **solution\_points** (*dict of str*) –

**The solution points info. Keys are:****names** [list of str] the solutions point names.**coordinates** [np.array, shape (n\_solutions\_points, 3)] the x,y,z coordinates of each solution point.

## 1.6 pycartool.io.inverse\_solution module

`pycartool.io.inverse_solution.read_is(filename)`

Read Cartool inverse solution (.is) file.

**Parameters** `filename` (*str*) – the is file to read.**Returns** the inverse solution matrices. `n_dim=1` if solutions are scalar or `n_dim=3` for vectorial solutions.**Return type** ndarray, shape (n\_regularizations, n\_dim, n\_solutionpoints, n\_channels)`pycartool.io.inverse_solution.read_ris(filename)`

Read Cartool Results of Inverse Solution computation (.ris) file.

**Parameters** `filename` (*str*) – the ris file to read.

**Returns****results\_of\_is** –**Keys are:****ris\_type** [str] magic should always be 'RI01'.**is\_scalar** [bool] True if solution is scalar, else False (vectorial).**sfreq** [float] sampling frequency (in Hz).**data** [np.ndarray, shape(n\_timeframes, n\_dim, n\_solutionpoints)] time course of each solution point.**Return type** dict of str`pycartool.io.inverse_solution.write_ris(path, data, sfreq)`

Short summary.

**Parameters**

- **path** (*str*) – Path of the exported inverse solution computation.
- **data** (*np.ndarray, shape(n\_timeframes, n\_dim, n\_solutionpoints)*) – time course of each solution point.
- **sfreq** (*float*) – sampling frequency (in Hz).

## 1.7 pycartool.io.leadfield module

`pycartool.io.leadfield.read_lf(filename)`

Read Cartool leadfield matrix.

**Parameters** **filename** (*str*) – The lf file to read.**Returns** **leadfield\_matrix** – the leadfield matrix.**Return type** ndarray, shape (n\_channels, n\_sources, 3)

## 1.8 Module contents

## PYTHON MODULE INDEX

### p
